Dear Editor,

The publication on dengue by Pereira et al. is very interesting¹. The way to control the health information on dengue as analyzed and described is very interesting. However, there are also issues for further thought. First, to have a system for quality control is important but there should be a way to continuously assure the sustainable quality. How to have a continuous quality improvement of the control system is very important. Second, it is no doubt that the sharing of the internet information can have some problems during transferring data from one to the others. How to verify the final data is the big question for public health practitioner. “How to set and promote a single standardized internet information for local people to access and refer to” should be the steps to further work. An interesting way for promote and control of the information might be the use of internet teleconsulting for letting the local people to communicate and ask the expert and get the correct qualified information².
